

ABSTRACT

To obtain a mobile telephone with remote-controlling capability easily available as a remote-controller.

Various remote control codes for predetermined various controlling operations on target equipment are associated with a plurality of operation buttons of an operation unit of a mobile telephone in a one-to-one relationship, and stored in memory of the mobile telephone. When an operation button is depressed, a control unit of the mobile telephone reads a remote control code associated with the depressed button from the memory, and transmits it to the target equipment using an infrared emission unit.
